It is proposed to construct a temporary water level control structure at the outlet from Smith and Bybee lakes near Columbia Slough River Mile 2.5.

This temporary structure will be constructed in a manner that will allow the summer water level of Smith and Bybee lakes to be maintained near elevation +11.0.

The fill material required to install this spillway will be obtained from an area of higher ground adjacent to the structure location.

A second minor fill will be placed adjacent to the Columbia Slough near river mile 1.75. This is necessary to close a small low spot in a natural levee system that would prevent the proposed spillway structure from functioning properly.

The purpose of holding the water level in the lakes at a higher level is to minimize or eliminate conditions which result in a botulism outbreak in the local waterfowl population during late summer.
