Tom Melville

Turbidity should not exceed 10% over background 100 ft. from work area.

✓ May try silt fence in Bybee L.
& pump into that "cove", allowing it to settle.

"Like on like" - DEQ allows it, e.g. MCSO's 1135 project

Tom sees no need to remove & haul off the dam soil - if he did, he wouldn't be issuing the 401(k) cert. He thinks my testing approach is adequate, but reminded me that he was issuing the 401(k) before the testing (i.e. not concerned w/ testing). He preferred an approach of testing after material removed & piled in temp. stockpiles because it would be composited & include sediments @ base & even under the dam a bit. When I mentioned the tight inwater work window & desire not to have construction paused while waiting on test results, he understood reasons behind my approach & was supportive.

Melville 8/10⁴/03

p.2.

I told Tom I was relieved to be able to re-use material on-site w/o any discomfort from DEQ. I added that I would call Mary Headley & ensure she/Corps was OK with re-using the dam soil. Tom offered to talk to Mary if she seemed uncomfortable & suggested I have her call him if she ~~was~~ needed to.
